Serial No.: 09/751,796

Date of Deposit: March 2, 2005

Attorney Docket No. 27996-028

Amendments to the Claims:

This listing of claims will replace all prior versions and listings of claims in the application:

Listing of the Claims:

1. (Currently amended) Apparatus that obtains call trace information, comprising:

a network compatible device that is configured to communicate over a packet switched

network with an end-point device, the network compatible device being configured to generate a

request for call trace information that pertains to the end-point device and to receive the call trace

information that was requested and to dynamically display at least a portion of the call trace

information that was received.

2. (Original) An apparatus as in claim 1, wherein the call trace information is selected

from a group consisting of an Internet Protocol (IP) address, a geographical location of the end-

point device, a type or class of the end-point device, a call route, a topology of the route, a

domain name server of the IP address and route, a directory number and name, a call back

number, an advisement as to whether the IP address for the end-point device is mobile and an

advisement as to what redirection may have occurred before the call was completed.

3. (Original) An apparatus as in claim 1, wherein the network compatible device is

configured to originate a conference call with a plurality of end points and to receive the call

trace information for each of the plurality of end-points.

4. (Original) An apparatus as in claim 3, wherein the network compatible device is a

circuit switched time division multiplex (TDM) compatible device.

5. (Original) An apparatus as in claim 1, wherein the network compatible device is a

circuit switched time division multiplex (TDM) compatible device.

Serial No.: 09/751,796

Date of Deposit: March 2, 2005

Attorney Docket No. 27996-028

6. (Original) An apparatus as in claim 1, wherein the network compatible device is a

voice over Internet Protocol compatible device.

7. (Original) An apparatus as in claim 1, further comprising at least one data base

containing the call trace information.

8. (Original) An apparatus as in claim 2, further comprising a call log that logs all the

call trace information.

9. (Currently amended) An apparatus that obtains call trace information, comprising:

a network compatible device that is configured to communicate over a packet switched

network with an end-point device, the network compatible device including means for generating

a request for call trace information about the end-point device, means for receiving the call trace

information that was requested and means for dynamically displaying at least a portion of the

call trace information that was received.

10. (Original) An apparatus as in claim 9, wherein the call trace information is selected

from a group consisting of an Internet Protocol (IP) address, a geographical location of the end-

point device, a type or class of the end-point device, a call route, a topology of the route, a

domain name server of the IP address and route, a directory number and name, a call back

number, an advisement as to whether the IP address for the end-point device is mobile and an

advisement as to what redirection may have occurred before the call was completed.

11. (Original) An apparatus as in claim 9, wherein the network compatible device is

configured to originate a conference call with a plurality of endpoints and to receive the call trace

information for each of the plurality of end-points.

12. (Original) An apparatus as in claim 10, wherein the network compatible device is a

circuit switched time division multiplex (TDM) compatible device.

Serial No.: 09/751,796

Date of Deposit: March 2, 2005

Attorney Docket No. 27996-028

13. (Original) An apparatus as in claim 9, wherein the network compatible device is a

circuit switched time division multiplex (TDM) compatible device.

14. (Original) An apparatus as in claim 9, wherein the network compatible device is a

voice over Internet Protocol compatible device.

15. (Original) An apparatus as in claim 9, further comprising means for storing the call

trace information.

16. (Original) An apparatus as in claim 9, further comprising means for logging the call

trace information.

17. (Currently amended) A method that obtains call trace information, comprising:

communicating over a packet switched network between a network compatible device

and an end-point device, generating a request for call trace information that pertains to the end-

point device, subsequently receiving the call trace information that was requested, and

dynamically displaying at least a portion of the call trace information that was received.

18. (Original) An apparatus as in claim 17, wherein the call trace information is selected

from a group consisting of an Internet Protocol (IP) address, a geographical location of the end-

point device, a type or class of the end-point device, a call route, a topology of the route, a

domain name server of the IP address and route, a directory number and name, a call back

number, an advisement as to whether the IP address for the end-point device is mobile and an

advisement as to what redirection may have occurred before the call was completed.

19. (Original) A method as in claim 18, further comprising logging the call trace

information.

20. (Original) A method as in claim 18, further comprising storing the call trace

information.

Serial No.: 09/751,796

Date of Deposit: March 2, 2005

Attorney Docket No. 27996-028

21. (Original) A method as in claim 18, further comprising originating a conference call

with a plurality of end-points and to receive the call trace information for each of the plurality of

end-points.

22. (Original) A method as in claim 21, wherein the network compatible device is a

circuit switched time division multiplex (TDM) compatible device that accesses the packet

switched network through a gateway.

23. (Original) A method as in claim 18, wherein the network compatible device is a

circuit switched time division multiplex (TDM) compatible device that accesses the packet

switched network through a gateway.

24. (Original) A method as in claim 18, wherein the network compatible device is a

voice over Internet Protocol compatible device.

25. (Currently Amended) An apparatus as in Claim 1, further comprising:

A a terminal proxy server, comprising software responsive to a request to download call

trace information and to transmit the downloaded call trace information to a network compatible

device, the call trace information selected from a group consisting of an Internet Protocol (IP)

address, a geographical location of the end-point device, a type or class of the end-point device, a

call route, a topology of the route, a domain name server of the IP address and route, a directory

number and name, a call back number, an advisement as to whether the IP address for the end-

point device is mobile and an advisement as to what redirection may have occurred before the

call was completed.

26. (Currently Amended) An apparatus as in Claim 1, further comprising:

A a terminal proxy server, comprising software responsive to a request for call trace

information to dynamically access and then transmit the call trace information to a network

Attorney Docket No. 27996-028

compatible device, the call trace information selected from a group consisting of an Internet

Protocol (IP) address, a geographical location of the end-point device, a type or class of the end-

point device, a call route, a topology of the route, a domain name server of the IP address and

route, a directory number and name, a call back number, an advisement as to whether the IP

address for the end-point device is mobile and an advisement as to what redirection may have

occurred before the call was completed.
